Microlab Model D2-D6 Power Splitters have been designed to evenly split high power signals with minimal reflections or loss. Units may also be used as low loss coherent combiners provided all inputs are both amplitude and phase coincident. Designed with only a few solder joints and an air dielectric, the loss has been minimized and reliability enhanced.

These dividers consist of radially symmetrical output branches emanating from a common junction. This junction is then transformed to the line by a series of cascaded quarter-wave transformers mounted within a coaxial housing.

See other models for designs to meet specific system requirements for bandwidth, size, connectors, etc. (01/13)
